Sam Laing 6283670 PML Theory Albert Catalan 6443478 $p(y|X) = \int p(y|f,X) p(f|X) df$ we have $p(f) \sim N(\mu,k) = p(f|X) = N(f,\mu_X,K_X)$ =>p(y|X) = \int N(y; f(x), \L) N(f; px, \Kxx) lf $=\int N(y; \mu_{X}, \Lambda + \chi_{xx}) N(f; (\Lambda^{-1} + \chi_{xx})^{-1} (\Lambda^{-1} + \chi_{xx})^{-1}) df$ The $=N(y; \mu_{X}, \Lambda + \chi_{xx}) \int N(f; (\Lambda^{-1} + \chi_{xx})^{-1} (\Lambda^{-1} + \chi_{xx})^{-1}) df$ wed $=N(y; \mu_{X}, \Lambda + \chi_{xx}) \int N(f; (\Lambda^{-1} + \chi_{xx})^{-1} (\Lambda^{-1} + \chi_{xx})^{-1}) df$ = N(jjmx, A+Kxx).1 (since me integrate over a distribution

b) i)
$$y \mid \chi \sim \mathcal{N}(\mu_{x}, \Lambda + \kappa_{xx})$$

$$= -\frac{1}{2} \{ E_{y|x} \left[(y - \mu_{x})^{T} (\kappa_{xx} + \Lambda)^{-1} (y - \mu_{x}) \right]$$

$$= -\frac{1}{2} \{ E_{y|x} \left[(y - \mu_{x})^{T} (\kappa_{xx} + \Lambda)^{-1} (y - \mu_{x}) \right] + n \log 2\pi \}$$

$$= -\frac{1}{2} tr \left[(\kappa_{xx} + \Lambda)^{-1} (\kappa_{xx} + \Lambda) + n \log 2\pi \} \right]$$

$$= -\frac{1}{2} tr \left[(\kappa_{xx} + \Lambda)^{-1} (\kappa_{xx} + \Lambda) - n \log 2\pi \} \right]$$

$$= -\frac{1}{2} tr \left[(1) + 0 - \frac{1}{2} \log \det(\kappa_{xx} + \Lambda) - n \log 2\pi \} \right]$$

$$= -\frac{1}{2} tr \left[(1) + 0 - \frac{1}{2} \log \det(\kappa_{xx} + \Lambda) - n \log 2\pi \} \right]$$

$$= -\frac{n}{2} \left[(1 + \log 2\pi) - \frac{1}{2} \log \det(\kappa_{xx} + \Lambda) \right]$$

(b) (7i) Kxx (0) log $p(y|X) = -\frac{1}{2} \left[(y - px)^{T} (Kxx + \Lambda^{-1})^{T} (y - px) + \log dit (Kxx + \Lambda^{-1}) + n \log_{2} \pi \right]$ Lets first prove the cosult & then prove the refined identities: $\frac{1}{2} \log p(y|X) = \frac{1}{2} \log p(y|X)$ we note that Do [(y-mx) (/xxx + 1) (y-mx)] = (20 (y-px)) (Kxx+1) (y-px) + (y-px) do(Kxx+1) + (y-px) (Xxx+1-1)-6(y-px) = (y-px) 20 (Kxx+1-1) (y-px) 0=-(y-nx)T(xxx+1-1) 3xxx (xxx+1-1)-)(y-mx Descriptifix = 15-px TXXX+11 2XXX+1

(asm) result = Do log p(y|x) = 1 [-(y-rx) [1xxx+1] (3kxx 1xx+1) [y-rx] + tr(1xxx 3kxx)] We now prove the two statements we made use of above:) let $K = K_{xx}(0)$ have inverse $H = H_{xx}(0)$ then KH = 11. differentiating both sides (and noting that the product rule applies for matrices) gives: (20 K) H + K (20H) = 0 => (2, H) = -(2, K)Hmultiplying both sides from the left by K = Hthen gives: $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ (this result holds of matrix of full rank)

We observe that since $K_{xx}(\theta)$ is $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ $\frac{\partial}{\partial \theta} (K_{xx}(\theta))^{-1} = -K_{xx} \frac{\partial K_{xx}}{\partial \theta} K_{xx}$ K,x(0) = U(0) D(0) U(0) T So we have $\mathcal{D}(0) = \text{diag}(\lambda_{j}(0))_{j=1}^{n}$ for continon $(\lambda_{j}:R-JR)_{j=1}^{n}$

Then let
$$(K_{xx}(0)) = \prod_{j=1}^{n} \lambda_{j}(0)$$

$$= \partial_{\theta} \log \left(\operatorname{let} (K_{xx}(0)) \right) = \partial_{\theta} \log \prod_{j=1}^{n} \lambda_{j}(0)$$

$$= \partial_{\theta} \sum_{j=1}^{n} \lambda_{j}(0) \lambda_{j}(0)$$

$$= \sum_{j=1}^{n} \frac{1}{\lambda_{j}(0)} \lambda_{j}(0) \left(\operatorname{product} \left(\sum_{j=1}^{n} \frac{1}{\lambda_{j}(0)} \lambda_{j}(0) \right) \right) \right)$$
we observe that $K_{xx} = \mathcal{N} \mathcal{P}(\theta) \mathcal{N}^{n}$
and $\mathcal{P}^{-1}(\theta) = \operatorname{diag} \left(1 / \lambda_{j}(0) \right) \right) = 1$

$$= \lim_{n \to \infty} \frac{2K_{xx}}{\partial \theta} = \mathcal{N} \operatorname{diag} \left(\lambda_{j}(0) \right) \mathcal{N}^{n}$$
we therefore $\operatorname{recognize} H_{\theta} = \operatorname{expression} \left(\mathcal{H} \right)$
as
$$\operatorname{tr} \left(\mathcal{N} \operatorname{diag} \left(1 / \lambda_{j}(0) \right) \right) \mathcal{N}^{n} \mathcal{N}^{n} \mathcal{N} \operatorname{diag} \left(\lambda_{j}(0) \right) \mathcal{N}^{n} \mathcal{N}^{n}$$

$$= \operatorname{tr} \left(K_{xx} \right) \frac{2K_{xx}}{\partial \theta}$$

$$= \operatorname{tr} \left(K_{xx} \right) \mathcal{N}^{n} \mathcal{N$$
